## WHAT IS CLAIMED IS:

1. A method for producing a magnetic recording medium having a nonmagnetic substrate coated with a magnetic coating material containing a ferromagnetic powder and a binder, wherein:

the magnetic coating material contains a liquid A constituted by the ferromagnetic powder and a solvent, and a solution B of the binder; and

the liquid A and the solution B are mixed together by applying an ultrasonic wave thereto, and are thereafter subjected to dispersion processing.

- 2. The method as defined in claim 1, wherein the ultrasonic wave is applied within one second after the liquid A and the solution B are mixed together.
- 3. The method as defined in claim 1, wherein the liquid A is subjected to dispersion processing by applying the ultrasonic wave thereto before the liquid A and the solution B are mixed together.
- 4. The method as defined in claim 1, wherein the ferromagnetic powder is a needle particle with a major axis length of 10 to 100 nm.
- 5. The method as defined in claim 1, wherein the ferromagnetic powder is a plate particle with a plate diameter of 10 to 50 nm.
- 6. A method for producing a magnetic recording medium having a nonmagnetic substrate coated with a magnetic coating material containing a ferromagnetic powder and a binder, wherein:

the magnetic coating material contains a liquid A constituted by the ferromagnetic powder and a solvent, and a solution B of the binder; and

the liquid A is subjected to dispersion processing by applying an ultrasonic wave thereto, and thereafter the liquid A and the solution B are mixed together.

7. The method as defined in claim 6, wherein the ferromagnetic powder is a needle

particle with a major axis length of 10 to 100 nm.

8. The method as defined in claim 6, wherein the ferromagnetic powder is a plate particle with a plate diameter of 10 to 50 nm.
